

Ultra-Thin with Wide Capabilities

Ultra thin flat panel monitors like those in Samsung's 9000 series have reduced size without reducing function. Measuring in at just 0.31 inches deep, the ultra-thin monitor blends harmoniously into its surroundings when not in use. The miniscule diameter also keeps the weight under 50 pounds making it easier to mount on walls without needing reinforcement. Despite its unbelievably thin design, it offers a 55 inch display capable of cinema-quality 3D video. It is also one of Samsung's Smart TVs meaning viewers can use their TV to surf the web, chat with friends, download apps and access virtually any online content.

Other manufacturers such as Panasonic also offer ultra thin flat panel monitors with many of their Viera Televisions being only a little over an inch in diameter. Like the Samsung 9000 series, the Viera Televisions are 3D capable and allow for an interactive TV experience with online connectivity. While the monitors themselves are becoming thinner, the wide array of abilities is becoming limitless.

Ensuring Visibility with Widescreen

Wide aspect ratio monitors, like the one seen here at DJ's Dugout in Downtown Omaha, NE, provide a clear image large enough for everyone to see. While this screen is mounted, wide aspect ratio screens can be rented for conventions, meetings, weddings and any other event.

Incorporating visual displays can benefit almost any event, but it can also create frustrations if not done effectively. Visibility issues can greatly reduce the impact of displayed content and cause irritation among event attendees. Choosing a wide aspect ratio screen for your event can help alleviate many visibility issues by providing a larger and more viewable image.

Whether showing videos at a wedding, a PowerPoint presentation at a meeting or a speech at a conference, the message becomes ineffective if it cannot be clearly seen. A wide aspect ratio screen not only increases visibility, but eliminates distracting scrolling and screen changes by allowing more content on the screen. They are better for viewing panoramic digital photographs and also help eliminate the cumbersome blank border that surrounds regular screens. Wide aspect ratio screens are also ideal for showing DVD videos as widescreen is most commonly filmmakers' format of choice.

Contact CONCEPTS AV Integration and speak with our rental department to ensure that, no matter what the event, your message is being seen.
